

## Creating virtual machine using virtual box.

- Step 1: Go to browser & search for virtual box.
- Step 2: Click oracle VM virtual box (<https://www.virtualbox.org>)
- Step 3: Download virtualbox 7.0.10 platform package for windows host
- Step 4: After clicking on the windows host, your executable file will get downloaded.
- Step 5: After downloading the executable file of virtualbox go to downloads and click on the executable file.
- Step 6: A setup wizard dialog box will be opened click next.
- Step 7: Custom setup and location where the virtual box need to install. You can install on any drive.
- Step 8: After setting the location click next. Then leave the options displayed on the screen as default and click next.
- Step 9: A warning for network interface will be shown if you are ok with it then click not.
- Step 10: Then on the next page click install.
- Step 11: After installation, just click finish on the new window with checkbox checked.
- Step 12: After closing the virtual box setup virtual box window will be opened.
- Step 13: After all these steps, your virtual box will be successfully installed.

## Steps to create virtual box - Virtual machine

Step 1: Open virtual box.

Step 2: Click new

Step 3: Enter the name of the virtual machine, location and type of VM and radius of the VM & click next.

Step 4: Allocate the hardware size & no. of processors and click next.

Step 5: After finishing the above step a summary will be displayed and click finish.

Step 6: For shrinking or expand the size of hard disk and go to tools → virtual media player and click on the VM that you have created.

Step 7: By clicking on it, the information will be displayed. But we can expand the disk size but can't shrink below the minimum size of the hard disk.

Step 8: At last, VM will be created.
